Questions

1. What is the disadvantage in comparing line segments by mere observation?
2. Why is it better to use a divider than a ruler, while measuring the length of a line segment?
3. Draw any line segment, say $\overline{AB}$. Take any point C lying in between A and B. Measure the lengths of AB, BC and AC. Is AB = AC + CB?

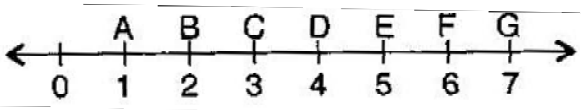
5. Verify whether D is the mid-point of $\overline{AG}$.



6. If B is the mid-point of $\overline{AC}$ and C is the mid-point of $\overline{BD}$, where A, B, C, D lie on a straight line, say why AB = CD?
7. Draw five triangles and measure their sides. Check in each case, of the sum of the lengths of any two sides is always less than the third side.

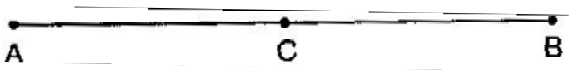
Answers

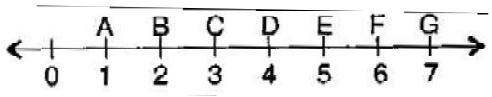
1. There may be chance of error due to improper viewing.
2. It is better to use a divider than a ruler, because the thickness of the ruler may cause difficulties in reading off her length. However divider gives up accurate measurement.
3. Yes.



AB = 6.5 cm, AC = 3cm, CB = 3.5 cm

AC + CB = 3 cm + 3.5 cm = 6.5 cm = AB

4. $\overline{AC}$ is the longest line segment, thus B is the point between A and C.
5. AD = 3 units, DG = 3 units



AD = DG.

Thus, D is the mid-point.

6. B is the mid-point of $\overline{AC}$.

$\therefore$ AB = BC .....(i)

And C is the mid-point of $\overline{BD}$.

$\therefore$ BC = CD .....(ii)

From eq. (i) and (ii),

AB = CD

7. Yes, sum of two sides of a triangle is always greater than the third side.
